ACCESSION NR: AP4047798

S/0021/64/000/010/1311/1313

AUTHOR: Filippenko, L. G.; Shcherban', O. N. (Shcherban', A. N.)  
(Academician AN UkrSSR)

TITLE: Utilization of heat generated by nuclear explosion for intensification  
of oil extraction 19

SOURCE: AN UkrRSR. Dopovidi, no. 10, 1964, 1311-1313

TOPIC TAGS: heat utilization feasibility

ABSTRACT: Referring to American technical literature the authors discuss the possibilities of using the heat of nuclear fission in oil extraction. They calculated the distribution of temperature in the soil, shortly following the explosion as well as a long time afterward. According to the authors, such utilization of heat is feasible. The mean temperature of the ground thus heated does not depend on the rate of the fission, but on the mechanical properties of the soil only. Orig. art. has: 7 formulas.

TITLE: Geotemperature field during mine ventilation in regions with an acutely continental climate

SOURCE: AN UkrSSR. Dopovidi, no. 9, 1966, 1157-1161

TOPIC TAGS: Laplace transform, heat conductivity

ABSTRACT: The authors present an approximate analytical solution of equations of non-stationary thermal conductivity

$$\frac{\partial U}{\partial \tau} = a \left( \frac{\partial^2 U}{\partial r^2} + \frac{1}{r} \frac{\partial U}{\partial r} \right), \quad (\tau > 0, R_0 < r < \infty);$$

$$U = U_0, \quad \tau = 0;$$

$$\lim_{r \rightarrow \infty} U = U_\infty, \quad \tau > 0,$$

with the boundary condition

Card 1/2

0926 1640

ACC NR: AP7005116

$$\frac{\partial U}{\partial r} - \frac{a}{\lambda} [U - U^*(r)] = 0, \quad r = R_s;$$

$$U^*(r) = \begin{cases} U_1, & k\tau_1 \leq r \leq k\tau_1 + \tau_1 \\ U_2, & k\tau_1 + \tau_1 < r \leq (k+1)\tau_1 \end{cases} \quad (k = 0, 1, \dots)$$

 $(U_0 = \text{const}, U_1 = \text{const}, U_2 = \text{const}; U_1 > U_2),$ 

by means of the Laplace transform.

The authors also give an expression for determining the coefficient of non-stationary heat-exchange. Orig. art. has: 1 figure and 24 formulas. JPRS,

TITLE: An ultrasonic echo ranging level indicator. Class 42, No. 181327

SOURCE: Izobreteniya, pravayshlennyye obraztsy, tovarnyye znaki, no. 9, 1966, 87

TOPIC TAGS: Liquid level indicator, ultrasonic equipment, electronic measurement

ABSTRACT: This Author's Certificate introduces: 1. An ultrasonic echo ranging liquid level indicator containing reference and measurement units with pickups, a probe pulse generator, and a level readout unit connected to the measurement unit. The device is designed for improved accuracy and for matching the operating times of the reference unit, measurement pickup and readout unit. Connected between the reference and measurement units is a reference pulse distributor with outputs corresponding in number to predetermined points for beginning level measurement. This distributor may be made in the form of a controlled delay line. 2. A modification of this indicator in which the outputs of the reference unit and probe pulse generator are connected to a coincidence circuit with an output which excites the measurement pickup when one of the reference pulses is generated. This output is connected through the reference pulse distributor to the probe pulse shaper. 3. A

modification of this indicator for measuring liquid levels at various temperatures and densities without additional adjustment. The reference pulse distributor in the instrument is made in the form of a counter with decoder. 4. A modification of this indicator in which the reference pulse distributor is made in the form of a shift register.

Vitamins B<sub>1</sub>, B<sub>2</sub>, and PP in bread from different kinds of flour. V. N. Bukin, L. Yu. Auerman, Z. I. Zaltseva, L. S. Kutsseva, V. F. Pashovkin, and V. V. Scherbatenko (A. N. Baksh Inst. Biochem. and All-Union Sci. Research Inst. Bread-Baking Ind., Moscow). *Voprosy Pitaniya* 12, No. 4, 29-34(1953).—Of the vitamins naturally occurring in the flour, bread retains for rye flour and wheat flour, resp., B<sub>1</sub> 70 and 80-85%, B<sub>2</sub> 88 and 64-79%, PP 95-100 and 95-100%. The retention of vitamins B<sub>1</sub> and B<sub>2</sub> by wheat bread varies with the grade of the flour. Of added vitamins, rye bread retains ½ of B<sub>1</sub>, B<sub>2</sub>, and PP; wheat bread retains B<sub>1</sub> 75-80, B<sub>2</sub> 50-61, and PP 80-90%. Part of the vitamin B<sub>2</sub> in the flour is firmly combined with protein, and may escape estn. Fermentation of the dough frees the vitamin B<sub>2</sub>, and thus seemingly high figures are obtained for bread, masking the deterioration. Rye and wheat contain 3 mg./kg. of vitamin B<sub>1</sub>, instead of the previously reported 1 mg./kg. For an adult engaged in light labor it is necessary to enrich all sorts of bread with vitamin B<sub>2</sub>, rye bread with vitamin PP, and some kinds of wheat bread with vitamins B<sub>1</sub> and PP. A. Mirkin

(Baking)

SHC: A RYU VAD 5/5  
Digestibility and nutritional value of rye bread depending on its moisture content. A. Yu. Grubina, V. V. Shcherbatenko, L. R. Mikulinskaya, and V. F. Pashovskii (All-Union Sci. Research Inst. Bakery Ind., Moscow). *Voprosy Pitanija* 14, No. 2, 27-30 (1958).—Three different samples of rye bread, differing in their moisture contents (55, 61, and 49%, resp.), excluding the bread crust, have been studied for their organoleptic properties (taste, porosity, color of the crust), phys. properties (percentage of porosity, sp. vol., compressibility, relative elasticity, and adhesiveness), and chem. properties (moisture, acidity, sugar, cellulose, and fat) and for the utilization of their proteins by human organism. The results indicate that the phys. properties are greatly changed by the moisture content of bread; that the normal taste of rye bread is affected when the moisture content is over 60%; that the chem. compn. of the bread is only slightly changed (sugar 1.32, 1.48, and 1.53; cellulose 1.02, 1.05, and 1.28; and fat 1.31, 1.3, and 1.38% for the breads contg. 55, 51, and 49% moisture, resp.); and that the nutritional value of the bread decreases with increasing moisture content (av. utilization values for the original bread—dietary proteins utilized by 4 men during a 3-day period with increasing the moisture content of the bread were 74.22, 71.62, and 69.4%, resp.).

TITLE: Objective Evaluating Methods for Quality of Bread (Ob'yektivnyye metody otseki kachestva khleba)

PERIODICAL: Standartizatsiya, 1957, # 6, pp 43-44 (USSR)

ABSTRACT: This article describes the mechanical methods used by the USSR bread-baking plants for evaluating bread properties. The following instruments are described and illustrated: photometer "ФТ -2", devised by the Institute of Light Technique (Svetotekhnicheskiy institut); device "ЦМ -3" for evaluating the color of flour; device "ВНИИХП-2" for evaluating the compressibility and relative resilience of bread. The general work principles of the instruments are described. There are 2 photographs.

TITLE: The quality of bread treated for extended storage

SOURCE: Khlebopекарная и кондитерская промышленность, no. 7, 1965, 6-8

TOPIC TAGS: food, food preservation

ABSTRACT: Several sterilization methods were developed for the 6-month preservation of rye bread in 1-kg loaves wrapped in soft covering. The methods involved a thermal 3-hour process, a 5-hour process, a two-step (1 hr, 40 min) process, and alcohol sterilization. Bread tested by the alcohol, the 3-hour, and the two-step methods was the usual GOST 2077-54 type, while bread tested in the 5-hour process had a lower moisture content. Although organoleptic and analytical indices of bread remained unchanged after the alcohol treatment, it acquired the smell and aftertaste of ethyl alcohol. Very slight alteration in bread quality resulted from the two-step procedure. After a 3-hour sterilization the taste and smell of the product resembled that of the scalded-dough bread. The 5-hour process resulted in a dark and pulpy interior with an unpleasant smell and aftertaste. Thermal treatment increased the concentration of water-soluble carbohydrates and resulted in

Card 1/2

L 62569-65

ACCESSION NR: AP5019203

dark colored products. Optimal storage temperature was 20C. Bread treated by the alcohol and the two-step methods had greater stability under higher storage temperatures (30-35C). A decreased sterilization period resulted in better quality and greater preservation ability at higher temperatures. Detailed experimental results are tabulated and illustrated graphically. Orig. art. has: 3 tables and 3 figures.

Photometric determinations in the near infrared region of a spectrum. I. D. P. Shcherbatov and P. I. Shevtsov. Izvest. Akad. Nauk Kazakh. S.S.R., Ser. Khim. 1957, No. 1, 25-31 (in Russian).—The absorption of water in the infrared region ( $\lambda = 0.995 \mu$ ) was utilized in the determination of the concn. of AcOH in nq. solns. The absorption of light by water in AcOH did not obey Beer's law. Nevertheless, it was shown that this method was adaptable for the detn. of water-rich org. or inorg. liquids. For AcOH solns. contg. 70, 45, 5, 15, 20, 00, 05, 0, 10, and 35% AcOH, the concn. of the acid from infrared spectrum of water was resp.: 69, 45, 4, 14, 20.5, 80, 65, 0, 10, and 34%. 83 references.
